

MARK SCHEME for the May/June 2014 series

0417 INFORMATION AND COMMUNICATION TECHNOLOGY

0417/22

Paper 2 (Practical Test A), maximum raw mark 80

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes should be read in conjunction with the question paper and the Principal Examiner Report for Teachers.

Cambridge will not enter into discussions about these mark schemes.

Cambridge is publishing the mark schemes for the May/June 2014 series for most IGCSE, GCE Advanced Level and Advanced Subsidiary Level components and some Ordinary Level components.

The UK fishing fleet in

EU Fishing fleet

- England
- Wales
- Scotland
- Northern Ireland
- Islands (Guernsey, Jersey and the Isle of Man)

Bullets

Square bullets applied 1 mark
Bullet indented to 2.5 cm 1 mark

In 2011, the highest number of fishing vessels in the European Union was Spain's with 6,444. Spain's fleet is almost double the size of the UK's fleet with 13,077 vessels. The following table provides more detail:

Body text

2 columns, 2 cm col spacing 1 mark
12 pt, serif font 1 mark
Single line spacing, fully justified 1 mark

The number of registered UK fishing vessels has fallen by 26% since 1996. This is due to a number of factors over the period.

Table

Complete, in correct place within column width 1 mark
Belgium row deleted (above Portugal) 1 mark
1st row – cells merged, heading centred, bold and underlined 1 mark
2nd row – bold, centred, headings wrapped 1 mark
Font matches body text (12 pt, serif) 1 mark
Text on one line (rows 3–12), numbers right aligned, gridlines displayed 1 mark

<u>LARGEST CAPACITY EU STATES</u>			
	Number of vessels	Gross Tonnage	Engine Power (kW)
Spain	10,503	398,894	900,663
United Kingdom	6,444	202,048	808,887
Italy	13,077	175,531	1,058,610
France	7,219	171,301	1,002,829
Netherlands	845	152,666	343,705
Portugal	8,380	101,575	371,579
Greece	16,663	83,804	483,193
Denmark	9,799	100,000	1,000,000
Germany	10,000	100,000	1,000,000
Ireland	10,000	100,000	1,000,000

Wales, accounting for 48%, whilst Scottish vessels make up 52%. Although Scotland has fewer vessels, they have the highest share of capacity and power. Part of the reason that England has a larger number of vessels but a smaller share of capacity and power is that the English fleet has a higher proportion of smaller vessels.

Auto filename & path

Each fleet in the UK are engaged in different fishing opportunities depending on the area of the country. The Scottish fleet are catching fish that are high volume but lower priced. This includes catches such as the herring and mackerel in the North Sea and West of Scotland waters. As a result the Scottish fleet has higher capacity vessels. These can cover large sea areas and catch several hundred tonnes of fish per vessel in order to be economically viable.

The English fleet are catching fish which are typically lower volume but higher priced, such as the Channel fisheries for sole and plaice. In addition, a greater proportion of the fleet are smaller vessels covering inshore areas. As a result the English fleet has a greater proportion of smaller vessels that are economically viable as they catch smaller quantities of more valuable fish.

Administration Port

In 2011 Newlyn in Cornwall had the largest number of vessels in its administration with 622; 88% of these were smaller boats. The fleet administered by Fraserburgh in Scotland administered fewer boats with 206 but by far the largest capacity with 35,100 gross tonnage and 96,400 kW power. The largest proportion of 10 metre and under vessels was in Hastings with 93%. Administration ports in Wales and the south and west coast of England also had large proportions of smaller vessels.

Vessel Age

In total, 62% of the UK fleet (whose age is known) were built more than 20 years ago. While the number of vessels being built since 1991 has decreased, the average capacity and power of these vessels has increased by 50%.

Centre number, Candidate number

Number of Fishermen

Since records began in 1938 the number of fishermen working on UK registered vessels has decreased by 74%. In the last decade the numbers have decreased by 15% from about 15,000 to 12,400. This decrease is due to reductions in fleet size and fishing opportunities. Milford Haven, Wales has the largest number of fishermen in the UK with 991, Newlyn in Cornwall has 872 and Fraserburgh has the largest number of fishermen in Scotland with 788.

Accidents, Lost Vessels and Fatalities

During 2011, 299 accidents involving UK registered fishing vessels were reported compared to 272 in 2010. There were 8 fatalities to crew compared with 5 in 2010 and 24 fishing vessels were reported lost. This is the highest number of lost vessels recorded since 2005. The routine wearing of personal flotation devices when fishermen are working on the open deck would reduce the unnecessary loss of life that often occurs when someone goes overboard.

Stock Recovery

Decommissioning exercises over the past decade have focussed on fleet targeting cod, vessels that used trawl fishing for whitefish and beam trawl fishing. This has reduced the over 10 metre fleet by 46% since 2001.

As part of the measures for recovery of fish stocks, sole and cod recovery zones were established to control fishing in specific areas. Vessels fishing with beam trawls or static nets of a certain mesh size had limits imposed on the number of days they could spend at sea.

To prevent growth in fishing activity in the sea areas to the west, an area was established known as the ‘Western Waters’ in which fishing effort is limited. Regulated activity is permitted for UK registered vessels in only four of the nine sea areas within the Western Waters. Ceilings exist on the maximum fishing effort to be exerted by large vessels targeting certain species in these areas.

Centre number, Candidate number of fishing vessels, reductions in quotas, fishing effort limits and stock management plans.

This report is intended to provide as accurate a picture as possible of fishing activity carried out by the UK fleet.

Landings

The value of fish landed by the UK fleet in 2011 increased compared with 2010. UK vessels landed 600,000 tonnes of sea fish (including shellfish) into the UK and abroad with a value of £828 million. This represents a 17% increase in value compared with 2010. The rise in value is mainly due

to an increase of more than 40% in the average value of pelagic fish.

Shellfish formed the majority of landings by the UK fleet into England, Wales and Northern Ireland whilst pelagic fish had the highest **share** of landings into Scotland. The large increase in shellfish landings may be due to diversion of fishing activity into this sector where there are fewer restrictions and quotas, and improvements in data collection and reporting.

There has been a drastic decline in the landings of demersal fish (eg cod, haddock and plaice) over the past 50 years. There are a number of causes including reductions in fleet size, declining fish stocks and restricted fishing opportunities. EU and UK regulation has limited demersal fishing activity in recent decades, through decommissioning
